# TK1000系列电磁流量计

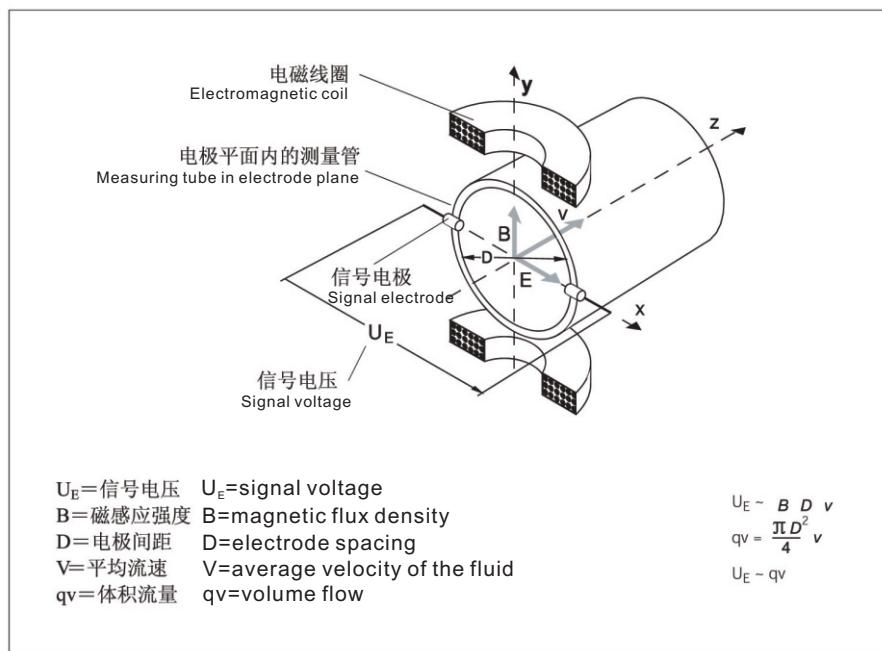

## Electromagnetic flowmeter for TK1000 series

### 工作原理

法拉第感应定律（指的是当导体通过磁场时会在导体内部产生感应电势）即为电磁流量计测量的基础原理。这种测量原理可应用于具有导电性的流体，该流体流入磁场垂直于流体方向的管道，在流体中感应生成的电势可利用对称布置的两个电极进行测量。信号电压 $U_E$ 与磁感应强度B, 电极间距D以及流体平均速度v成正比。由于磁感应强度B与电极间距D为常量，所以信号电压 $U_E$ 与平均流速v成正比。用于计算体积流速的等式表明信号电压 $U_E$ 与体积流量成线性正比。

感应的信号电压被转化为转换器中的分度，模拟以及数字输出信号。

Ex防爆设计，符合国家防爆技术要求，已通过鉴定验收，可应用于各类防爆场所。

### Working principle

Faraday law of electromagnetic induction (It means when the conductor flow through the magnetic field, it can cause induced electromotive force in conductor). It is the measuring principle of electromagnetic flowmeter. This measuring principle can be applied to conductive fluid. The fluid flows into a pipeline which is perpendicular to the direction of the fluid. The electromotive force induced in the flow can use the two symmetrical electrodes to measure. Signal voltage  $U_E$  is proportional to magnetic flux density B, electrode spacing D and average velocity of the fluid V. Magnetic flux density B and electrode spacing D are constants, so signal voltage  $U_E$  is proportional to average flow velocity of the fluid V. Equation for calculating the volume flow rate means signal voltage  $U_E$  is linearly proportional to volume flow.

The induced signal voltage is converted to the indexing of the converter, analog and digital output signals.

## 衬里材料的选择 Selection of lining material

应根据被测介质的腐蚀性、磨损性及温度来选择。硬/软橡胶可耐一般的弱酸、碱的腐蚀，耐温65°C，软橡胶有耐磨性，聚四氟乙烯(PTFE)几乎能耐除热磷酸以外的强酸、碱腐蚀，介质温度可达130°C，但不可耐磨损。聚胺脂橡胶有较好的耐磨损，但不耐酸、碱腐蚀，耐温度性也较差，介质温度小于65°C。

Soft rubber has wear resistance. Polytetrafluoroethylene(PTFE) can resist the corrosion of alkali, strong acid except hot phosphoric acid. Medium temperature can be up 130°C, but can't resist abrasion. Urethane rubber has good abrasiveness, but can't resist the corrosion of acid and alkali, temperature resistance is also poor. ## 防护等级的选择

按照国际GB/T4208-1993关于外壳防护等级可分为：IP65为防喷水型，即可允许水龙头从任何方向对仪表喷水，喷水压力为30kPa，出水量为12.5升/分，喷水离仪表距离3米。IP67为防浸水型，即仪表可短时间全部浸入水中，试验时最高点应在水下至少150cm，持续时间至少为30分钟。IP68为潜水型，应能长期在水中工作，其浸入的最大深度由制造厂与用户协商。防护等级选用原则应根据以上要求及仪表实际的条件选定。若仪表在地面以下的，经常受水淹的，宜选用IP68；若仪表在地面上的，可选用IP65。

## Selection of protection level

According to the international GB/T4208-1993 for the shell protection level,it can be divided into: anti water spray type-IP65,it allows the faucet to water from any direction of the instrument, the water spray pressure is 30kPa, the water volume is 12.5 liters / min, water spray from the meter distance is 3 meters; Water immersion proof type-IP67,Instruments can be immersed in water for a short time.The highest point should be at least 150cm in the water when it is tested, and it should last for at least 30 minutes;Diving type-IP68,it can work in the water for a long time.The maximum depth of immersion should be negotiated with the manufacturer .The selection principle of the protection level should be selected by the above requirements and the actual conditions of the instrument.If the instrument is below the ground, and it is often flooded,you can choose IP68; if the instrument is on the ground,you can choose IP65.

## 电磁流量计的正确安装

### 1. 安装场所的选择

- 选择测量管内不会出现负压的场所；
- 避免安装在电机、变压器强电设备附近，以免引起电气干扰；
- 避免安装位置周围有强腐蚀性气体的场；
- 测量混合相流体时，避免引起相分离的场所；
- 环境温度一般在-25°C~60°C范围内，尽可能避免阳光直射；
- 安装在无振动或选择振动小的场合，如果振动过大，应该在传感器前后的管道上加固定支撑；
- 环境相对湿度应该在5%-90%范围内；
- 避免安装在能被雨水直淋或者浸没的场所；

## Correct installation of electromagnetic flowmeter

### 1. Selection of installation site:

- Choose a place where negative pressure will not appear in the measuring tube;
- Avoid installing in the motor place, near the transformer in electrical equipment place, so as not to cause electrical interference;
- Choose a place to avoid strong corrosive gas around the installation position.
- When measuring mixed phase fluid, we should choose a place to avoid causing phase separation;
- Ambient temperature is generally in the range of -25°C ~ 60 °C, and it should avoid the direct sunlight.
- Installed in a place without vibration or a place with small vibration. If the vibration is too large, it should be fixed a support in front of the sensor and behind the sensor.
- Relative humidity of environment should be in the range of 5%-90%
- Avoid installing in the place where the rain can be directly poured or immerged;

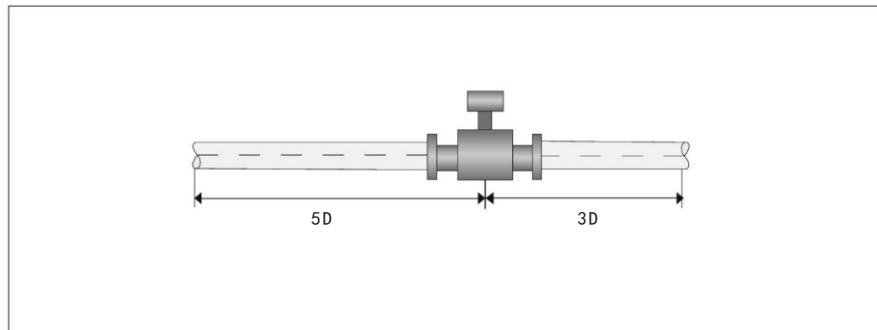

## 2. 对直管段长度的要求 (D为流量计的内径 )

电磁流量计对前后直管段的要求比较低，一般对900°弯头，T形三通、异径、全开阀门等流动阻力件，离电磁流量计的电极轴中线(不是传感器的端面)应该有5D的直管段；对于不同开度的阀门(比如可调开度的阀门)，则上游侧的直管段长度需要10D。一般传感器下游的直管段只需要3D就可以满足要求。

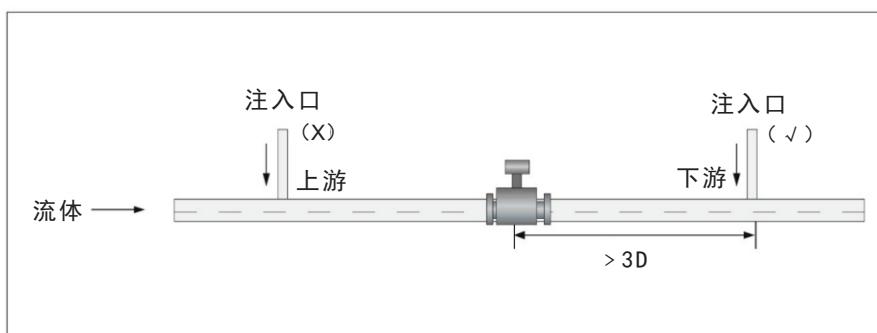

### 1. Requirements for length of straight pipe ( D is the inner diameter of the flowmeter. )

Electromagnetic flowmeter has lower requirement for the straight pipeline. For 90° elbow, flow resistance parts, like T-type three links, different diameter, fully open valve, the center line of the electrode for the electromagnetic flowmeter (not the end of sensor) should have 5D straight pipe. For different open degrees of the valve (such as adjustable open valve), the upstream side of the straight pipe length needs 10D. The downstream side of the straight pipe length only needs 3D.

如下图所示 Shown as the following figure:

测量不同介质的混合液体时，混合点与流量计之间的距离至少要大于 30D，如下图所示：  
When measure the mixed liquid of different medium, the distance between the mixing point and the flow meter must be at least more than 30D, shown as the following figure:

## 3. 安装位置和流动方向

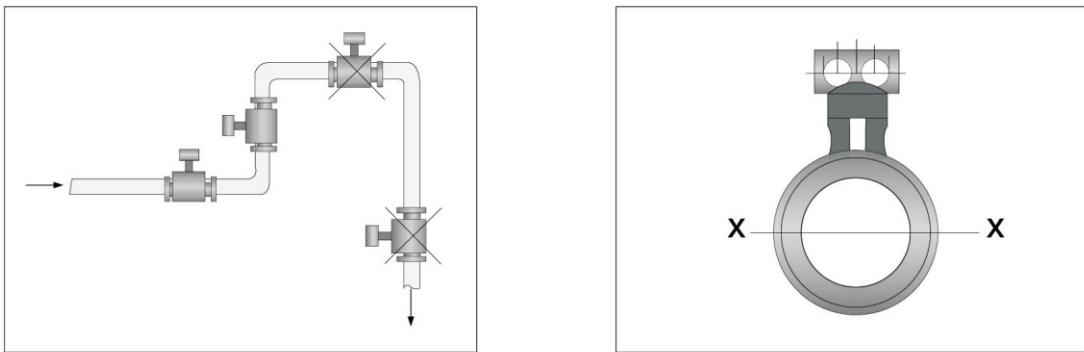

电磁流量计可以水平、垂直和倾斜安装在管道上：

在水平安装时，电磁流量计的电极轴必须水平，防止由于流体所夹带的气泡而产生电极短时间的绝缘，也可以防止电极被流体中的沉积物覆盖。不应该将传感器安装在最高位置处，以免有气体积聚。

### 3. Installation position and flow direction:

The electromagnetic flowmeter can be installed on the pipe in horizontal, vertical and inclined way:

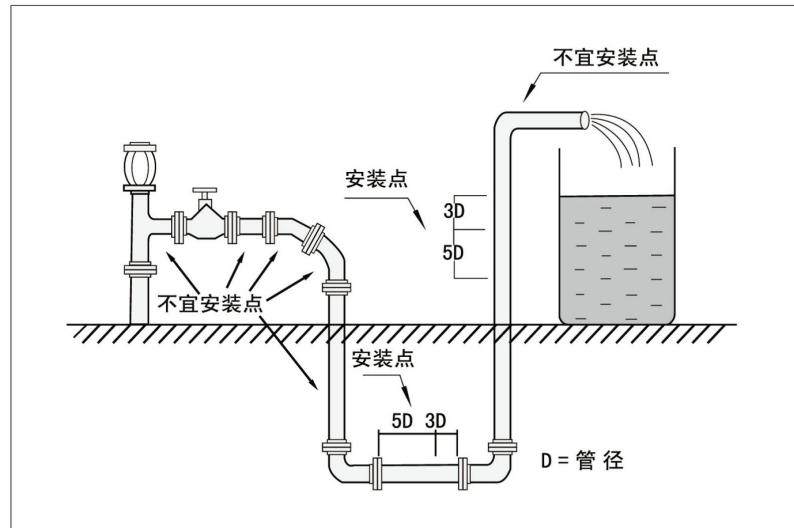

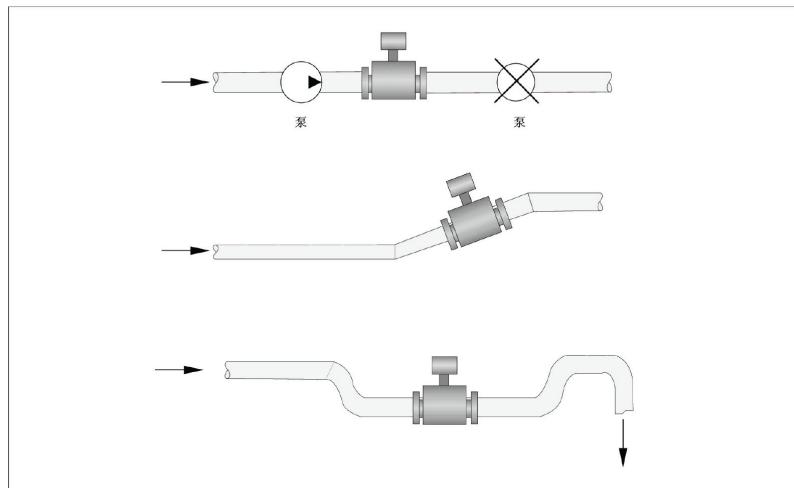

When it is installed in horizontal way, the electrode shaft of the electromagnetic flowmeter must be horizontal. It can prevent electrode insulation for a short time because of bubbles carried by fluid. The electrode can also be prevented from being covered by the sediment in the fluid. The sensor should not be installed at the highest position, so as to avoid the accumulation of gas.

垂直安装时，应该使流动方向向上，这样可以使无流量或者流量很小时，流体中夹带的较重固体颗粒下沉，而轻的脂肪类物质上升离开电磁流量计的传感器电极区，在测量泥浆、矿浆等液固两相介质时避免固相沉淀和传感器衬里不均匀摩擦。如图所示。

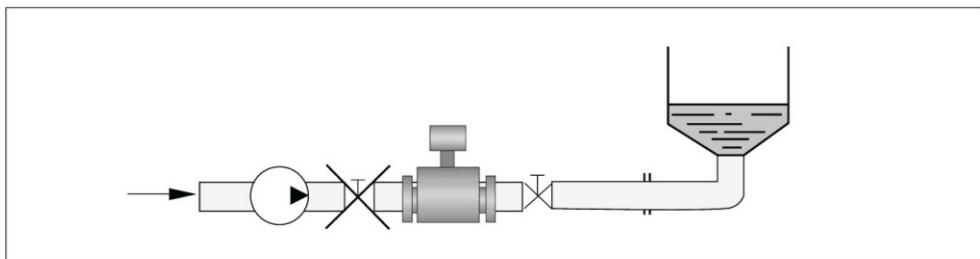

传感器的测量管道必须充满流体，必须有一定的背压。为防止出现负压(损坏衬里)，电磁流量计不应该安装在泵的进口，而应该安装在泵的出口；在倾斜安装时，必须安装在上升管道；在开口排放的管道安装时，必须安装在管道的较低处。

When it is installed in vertical way.The flow direction should be upward,in this case ,when there is no flow or the flow is very small,the sinking of heavier solid particles entrained in fluid.The light of the fat mass rises away from the sensor electrode area of the electromagnetic flowmeter,In the measurement of liquid-solid two-phase medium,like slurry and pulp,it can avoid solid precipitation and uneven friction of sensor lining.shown as the following figure. Measuring pipe of sensor must be full of fluid and a certain back pressure.In order to prevent negative pressure (damage to the lining).Electromagnetic flowmeters should not be installed in the pump inlet,it should be installed in the pump outlet;When it is installed in inclined way,it must be installed in the rising pipe;When it is installed in open discharge pipe ,it must be installed in the lower parts of the pipe.

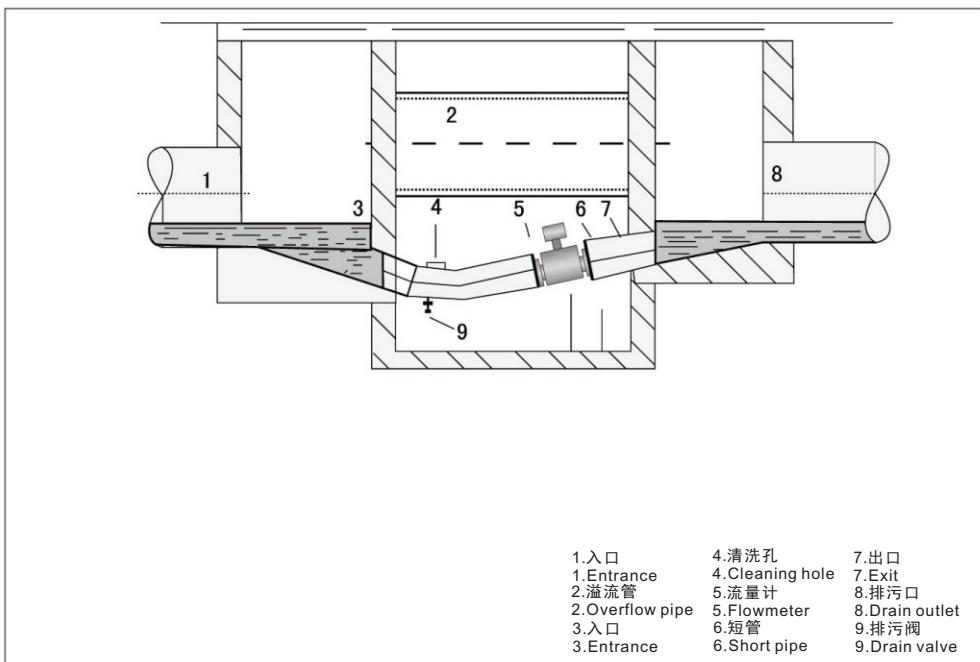

应在传感器的下游安装控制阀和切断阀，而不应该安装在传感器上游

Control valves and cut off valve should be installed in downstream of the sensor,not in upstream of the sensor
