三、产品说明

传感膜头

3051C型采用先进技术及生产线制造的高品质传感器。传感器与过程介质和外部环境保持机械、电气及热隔离。传感器远离过程法兰移至传感器外壳的颈部，可实现机械隔离和热隔离。该设计使传感器不与过程热源直接接触，并释放了传感器杯体上的机械应力，可提高静压性能。

玻璃密封的压力输送管与传感器杯体绝缘安装，保证了电气绝缘，可提高电子线路的灵活性、性能与耐瞬变电压保护的能力。

3051C型传感膜头还进行温度测量，用于补偿温度影响。

在工厂的特性化过程中，所有传感器都经受了整个工作范围内的压力与温度循环测试。根据由此得来的数据产生修正系数，然后将系数贮存于传感膜头的内存中，从而可保证变送器运行过程中能精确地进行信号修正。

该种传感膜头的内存也可帮助加快维修过程。因为所有膜头的特性值都贮存于膜头中，所以可直接更换线路板而无需重新校验或拆下独立的贮存。使用HART手操器可以方便地对3051型进行组态。组态由两部分组成。首先，设定变送器的工件参数，包括：存修正系数的PROM。

传感膜头内还有线路板，它将输入的电容与温度信号直接转换成可供电子板模块进一步处理的数字化信号。

电子线路板

电子板采用专用集成电路(ASIC)与表面封装技术。该板接收来自传感膜头的数字输入信号及其修正系数，然后对信号进行修正与线性化。电子板模块的输出部分将数字信号转为模拟输出，并与HART手操器进行通讯。标准的模拟输出为4~20mA。

可选液晶表头插在电子板上，以压力、流量或液位工程单位或模拟量程百分比显示数字输出，变送器均可选用液晶表头。

数据存储

组态数据贮存于变送器电子板模块的永久性EEPROM存储器中。变送器掉电后，数据仍保存，故而上电后变送器能立即工作。

数/模转换与信号传递

过程变量以数字式数据贮存，可以进行精确地修正和工程单位的转换。信号经修正后的数据转换为模拟输出信号。HART手操器可以直接以数据信号方式存取传感器读数，不经过数/模转换以得到更高精度。

III. Product Description

Sensing film head

3051C is high quality sensor manufactured with advanced technology and production line. The sensor is isolated mechanically, electrically and thermally from process medium and external environment. The sensor is away from the process flange, moved to the neck of the external electronic shell and able to realize the mechanical and thermal isolation. With this design, the sensor does not contact directly the process thermal source and the mechanical stress on the sensor cup is released so that the static pressure performance can be improved.

The pressure transportation pipeline sealed with glass is installed with sensor cup in insulated way, which guarantees the electric insulation, improves the flexibility and performance of electronic circuit and the protection ability to withstand transient voltage.

3051C sensing film head can also be used to measure the temperature and compensate for the temperature influence.

During the plant characterization process, all the sensors experience the pressure and temperature cycle test within the whole operation range. The correction coefficient is produced based on the obtained data and then the coefficient is stored in the memory of the sensing film head so as to guarantee that the transmitter can make correct signal correction during the operation.

The memory of this kind of sensing film head can also help facilitate the maintenance. Since all the characteristic value of the film head is stored in the film head, the circuit board can be replaced directly without re-calibration or removing the independent storage. It is easy to configure 3051 type with HART communicator. The configuration consists of two parts. Firstly, set the working parameters of the transmitter, including: store the PROM of correction coefficient.

There is also circuit board in the film sensing head which converts directly the input capacitance and temperature signal to the digital signal which can be further processed by the electronic board module.

Electronic circuit board

The electronic circuit board uses special integrated circuit (ASIC) and surface mount technology. This board receives the digital input signal from the sensing film head and its correction coefficient and then make correction and linearization for the signal. The output part of the electronic board module converts the digital signal to analog output and communicates with the HART. Standard analog output is 4~20mA.

Optional liquid crystal meter is inserted on the electronic board which shows the digital output with pressure, flow or liquid level engineering unit or analog range percentage. The transmitter can use liquid crystal meter.

Data storage

The configuration data is stored in the permanent EEPROM memory of the electronic board module of the transmitter. After the transmitter loses power, the data is still kept, thus the transmitter can start work immediately after power on.

D/A conversion and signal transmitting

The process variable is stored in the form of digital data which can correct accurately the conversion with engineering unit. The signal is converted to analog output signal via converted data. HART device can access directly the reading of sensor in the form of the digital signal and get higher accuracy without A/D conversion.

通讯格式

3051型采用HART协议进行通讯, 该协议使用了工业标准Bell202频移调制(FSK)技术。在模拟输出上叠加高频信号可以进行远程通讯。采用该技术, 能在不影响回路完整性的情况下, 实现同时通讯和输出。

软件功能

HART协议使用户可以容易地使用3051型的组态, 测试与具体设定的功能。

组态

使用HART手操器可以方便地对3051型进行组态。组态由两部分组成。首先, 设定变送器的工参参数, 包括: 零点与量程设定点。

线性或平方根输出

阻尼

工程单位选择

其次, 可将信息性数据输入变送器, 以便对变送器进行识别与物理描述, 包括:

工位号: 8个字母数字字符
描述符: 16个字母数字字符
日期
一体化表头安装
法兰类型 排液 / 排气
阀材料 O型环材料
远传信息

除以上讨论的可组态参数外, 3051型软件中还包括一些用户不可变更的信息: 变送器类型, 传感器极限值, 最小量程, 灌充液, 隔离膜片材料, 膜头系列号及变送器软件版本号。

测试

3051型可以进行连续自检。当出现问题时, 变送器将激活用户选定的模拟输出报警。HART手操器可以查询变送器, 确定问题所在。变送器向手操器输出特定信息, 以识别问题, 从而快速而便捷地采取维修措施。若操作员确认是回路有问题, 可让变送器给出特定输出, 以供回路测试。

具体设定

在变送器初始化阶段和数字电子板维护时需进行具体设定。它允许对传感器与模拟输出进行微调以符合工厂压力标准。此外, 特性化功能令用户可防止模拟输出设定点被意外或故意调整。

四、选项

液晶表头
M5数字表头, 液晶显示
直接显示数字数据, 精度更高

Communication format

3051 type adopts HART protocol for communication which uses industrial standard Bell202 frequency shifting keying (FSK) technology. High frequency signal is superposed on the analog output to make remote communication. This technology enables communication and output at the same time without affecting the integrity of the circuit.

Software function

HART protocol enables the user to use easily the 3051 type configuration and test the specifically set functions.

Configuration

It is easy to configure the 3051 type with HART communicator. The configuration consists of two parts. Firstly, set the working parameters of the transmitter, including: zero point and range set points

Linear or square root output

Delay time

Selection of engineering unit

Secondly, the information data can be input to the transmitter so that the transmitter can make recognition and physical description, including:
Work position No.: character of eight letters and number
Descriptor: character of sixteen letters and number
Date
Integrated meter installation
Flange type: liquid/air drain
Valve material: O-ring material
Remote transmitting information

Apart from the configurable parameters above, there is also some information that the user can not change in the 3051 type software: transmitter type, limit value of the sensor, minimum range, filling liquid, material of isolation diaphragm, film head type and version of transmitter software.

Test

3051 type can make continuous self-check. When there is problem, the transmitter will activate the analog output alarm selected by the user. HART device can inquire about the transmitter and determine the problems. The transmitter outputs specific information to the HART device so as to recognize the problem and take maintenance measures rapidly and conveniently. When the operator confirms that there is problem with circuit, he can let the transmitter give specific output to test the circuit.

Specific setting

Specific setting is required during initialization of transmitter and maintenance of digital electronic board. It allows the fine tuning of the sensor and analog output so as to meet the pressure standard of the plant. Besides, characterized function enables the user to prevent the analog output setting point from accident or intentional adjustment.

Application occasions

Application When liquid, gas and steam is measured
4-20mA (output code A)

Output

Two wire 4-20mA, the user can select linear or square root output. The digital process variable is superposed on the signal of 4-20mA, applicable to the host using HART protocol.
